神戸大学 前期日程 対策 ／ 問題

注意　解答はすべて解答用紙の指定のところに記入しなさい。

外国語（英　語）　　125点

注意

1. この冊子は問題部分と解答用紙からなる。解答はすべて解答用紙の指定のところに記入しなさい。
2. 大問は I〜IV の4題，配点は I 35点・II 35点・III 30点・IV 25点（計125点）。
3. 字数指定のある日本語の解答では，句読点も1字に数える。
4. 本冊子の英文・設問・図表はすべてオリジナルで，IV の図表のデータは架空のものである。

神戸大学の過去問・公式問題ではありません。予想問題であり，大学とは関係がありません。
本冊子は過去の出題形式を分析して作成した練習用の教材です。

I 評論（配点 35点）

次の文章は，道案内アプリと人間の空間の感覚について書かれたものである。この文章を読んで，問1〜5に答えなさい。（配点 35点）

Not long ago, finding your way around an unfamiliar city required a certain amount of effort. You studied a paper map before setting out, asked strangers for directions, and paid close attention to landmarks so that you could find your way back. Today, most of us simply type an address into a phone and follow the blue line. The app tells us when to turn, warns us about traffic, and even estimates the minute of our arrival. It is hard to imagine a more convenient tool, and few people would want to return to the days of folding and refolding enormous maps on a windy street corner.

Yet some psychologists have begun to ask whether this convenience comes at a hidden cost. Their concern is not that the apps are inaccurate; on the contrary, they are usually extremely reliable. The worry is rather that (1)this very reliability allows us to stop paying attention to our surroundings. When every turn is announced in advance, there is little reason to notice which way we are facing, how one street relates to another, or what the neighborhood looks like. We arrive at our destination, but we may have only the vaguest idea of how we got there.

To understand why this might matter, it helps to distinguish between two ways of finding a route. The first is to follow a sequence of instructions: turn left at the bank, go straight for two blocks, turn right at the station. The second is to build what researchers call a “mental map,” an inner picture of how places are arranged in relation to one another. People who rely on a mental map can (a)improvise when a road is closed or when they want to take a shortcut. People who know only a sequence of instructions are lost the moment the sequence breaks down.

Navigation apps encourage the first strategy and make the second almost unnecessary. Some small-scale experiments suggest that people who reach a place by following turn-by-turn directions remember less about the route afterward than those who find their way using a map. (A) such findings are still being debated, they fit a broader pattern that is familiar from other areas of life. Just as people who rely on a calculator may find mental arithmetic harder, those who always follow a screen may find it harder to (b)orient themselves without one.

It would be easy to turn this argument into a simple warning against technology, but that would be a mistake. Tools that take over mental tasks have a long history. Writing allowed people to stop memorizing long poems and lists, and few would argue that literacy has made humanity less intelligent. Freed from the need to remember everything, people could devote their attention to other things. In the same way, a driver who does not have to worry about the

next turn may be a calmer and therefore (B) driver. The question is not whether we should use such tools, but how.

One answer is to use them more actively. Instead of following the blue line without thinking, a traveler can glance at the whole route before starting, notice where the river or the main road lies, and try to predict the next turn before the app announces it. Such habits take a little more effort, but they turn a passive experience into a learning one. (2)What is lost is not the ability to find our way but the habit of using it, and habits can be rebuilt.

There is also something to be said for occasionally getting lost. Wandering through an unfamiliar area without a fixed plan can lead to serendipitous* discoveries that no app would suggest: a quiet park, a bakery on a side street, a view of the hills from an unexpected angle. These experiences are not merely pleasant. They are also the raw material of the mental maps that make a place feel familiar rather than (C). Seen in this light, a wrong turn now and then is less a failure than a modest (c)investment, and the occasional (d)detour may be the shortest way to really knowing a place.

注

turn-by-turn directions	曲がり角ごとの道案内
serendipitous	思いがけない幸運な
literacy	読み書きの能力

問 1 下線部(1)の this very reliability が表す内容を，40字以内の日本語で説明しなさい。ただし，句読点も1字に数える。

問 2 下線部(a)〜(d)の語について，本文中における意味に最も近いものを，それぞれの選択肢(あ)〜(え)から一つ選び，記号で答えなさい。

(a) improvise

(あ) give up
(い) find another way on the spot
(う) ask for help
(え) follow the rules strictly

(b) orient

(あ) find their position and direction
(い) travel to Asia
(う) introduce themselves
(え) develop their skills

(c) investment

(あ) an expense that brings later benefits
(い) a waste of money
(う) a sudden accident
(え) a business plan

(d) detour

(あ) a roundabout route
(い) a guided tour
(う) a traffic jam
(え) a final destination

問 3 本文中の(A)〜(C)の空所に入る最も適切な語の組み合わせはどれか。選択肢(あ)〜(え)から一つ選び，記号で答えなさい。

	(A)	(B)	(C)
(あ)	Because	safer	strange
(い)	Although	safer	strange
(う)	Although	slower	familiar
(え)	Unless	slower	strange

問 4 下線部(2)を，it の内容を明らかにしたうえで，日本語に訳しなさい。

問 5　本文の内容と合致する文を選択肢の中から二つ選び，記号で答えなさい。

(あ) The psychologists mentioned in the passage are mainly worried that navigation apps often give wrong directions.

(い) People who have a mental map can deal with a closed road more easily than those who only follow instructions.

(う) The author argues that people should stop using navigation apps altogether.

(え) According to the author, writing freed people from having to memorize everything.

(お) It has been firmly established that using navigation apps damages the human brain.

(か) Getting lost is described as entirely unpleasant and of no value.

II 評論（配点 35点）

次の文章は，発酵と微生物について書かれたものである。この文章を読んで，問1〜5に答えなさい。（配点 35点）

Long before anyone knew that microorganisms existed, people around the world were putting them to work. Bread rose, milk thickened into yogurt, cabbage turned sour, and grape juice became wine. These changes were often regarded as mysterious, and the knowledge of how to bring them about was passed down from one generation to the next as a craft rather than a science. Only in the nineteenth century did researchers demonstrate that such transformations, which we now call fermentation, are carried out by living things far too small to be seen with the naked eye.

At its simplest, fermentation is a way in which certain microorganisms obtain energy from sugars without needing oxygen. Yeast*, a single-celled fungus, breaks sugar down into alcohol and carbon dioxide. In bread, the alcohol largely evaporates during baking, while the bubbles of carbon dioxide are trapped in the dough and make it rise. Lactic acid bacteria*, by contrast, convert sugar mainly into lactic acid. This acid is what gives yogurt and pickles their sharp taste, and it also changes the texture of food, causing the proteins in milk, for example, to thicken.

For most of human history, however, the greatest value of fermentation lay not in flavor but in preservation. Before refrigeration, keeping food from spoiling was a constant struggle. Fermentation offered an ingenious solution. As useful microorganisms multiply, they produce acid or alcohol and use up the available sugars, creating conditions in which most of the microbes that cause food to rot cannot survive. (1)In effect, people were enlisting one group of microorganisms to defend their food against another. Milk that would have gone bad in a day or two could be kept for weeks as cheese, and vegetables harvested in autumn could be eaten through the winter.

Fermentation can also make food more nutritious and easier to digest. Some microorganisms break down substances that the human body has difficulty processing, and some produce vitamins that were not present in the original ingredients. Soybeans, for instance, are hard to digest when eaten raw, but fermentation transforms them into foods such as miso and soy sauce, which have been (A) parts of Japanese cooking for centuries. In this way, a process that began as a means of storage also shaped the cuisines and diets of entire cultures.

In recent years, fermented foods have attracted renewed interest, partly because of research into the vast community of microorganisms that lives in the human gut*. Scientists have learned that these microbes play a part in digestion and may influence other aspects of health as well. It is tempting to conclude that eating more fermented food will automatically

improve this inner community, and advertisements often make such claims. (B), the evidence is more complicated. Many of the microorganisms in fermented foods do not survive the journey through the stomach, and the effects of those that do appear to vary greatly from person to person. (2)For these reasons, many researchers urge caution about the health claims attached to fermented products.

Fermentation is not limited to the kitchen. The same basic processes are now used on an industrial scale to manufacture medicines, vitamins, and other useful substances. Microorganisms can be grown in huge steel tanks and, in some cases, altered so that they produce materials that they would not make in nature. (C) a craft once practiced in farmhouses and small workshops has become one of the foundations of modern biotechnology*.

Perhaps the most remarkable thing about fermentation is the partnership it represents. The microorganisms involved are not tools that we invented; they are living things with their own needs, which we have learned to (a)accommodate. A baker who keeps a starter dough alive for years, feeding it flour and water, is in a sense tending a tiny ecosystem. Our ancestors could not see their invisible helpers, but they understood, through long experience, how to create conditions in which those helpers would thrive. That understanding, refined over thousands of years, is (D) the reason why fermented foods remain part of our daily lives, and it reminds us that some of humanity's most (b)enduring achievements depend on cooperation with organisms we cannot even see.

注

yeast	酵母
lactic acid bacteria	乳酸菌
gut	腸
biotechnology	生物工学

問 1 下線部(1)を日本語に訳しなさい。

問 2 空所(A)～(D)に入る最も適切な表現を，それぞれの選択肢(あ)～(え)から一つ選び，記号で答えなさい。

(A)

(あ) essential (い) temporary (う) foreign (え) harmful

(B)

(あ) In reality (い) As a result (う) For example (え) In addition

(C)

(あ) In this way (い) On the other hand (う) Even so (え) By mistake

(D)

(あ) ultimately (い) hardly (う) never (え) rarely

問 3 下線部(2)のように多くの研究者が慎重な姿勢を求めているのはなぜか。その理由を，本文の内容に即して70字以内の日本語で説明しなさい。ただし，句読点も1字に数える。

問 4 本文の内容と合致する文を選択肢の中から二つ選び，記号で答えなさい。

(あ) People began to make fermented foods only after microorganisms had been discovered.
(い) When bread is baked, carbon dioxide produced by yeast helps the dough rise.
(う) Lactic acid bacteria turn sugar mainly into alcohol and carbon dioxide.
(え) Fermentation helped people keep food for long periods before refrigerators existed.
(お) Scientists have proven that eating fermented food always improves the health of the gut.
(か) Microorganisms used in industry cannot be changed to produce new substances.

問 5 下線部(a)・(b)の語について，本文中における意味に最も近いものを，それぞれの選択肢(あ)〜(え)から一つ選び，記号で答えなさい。

(a) <u>accommodate</u>

(あ) provide rooms for　(い) adapt to　(う) ignore　(え) get rid of

(b) <u>enduring</u>

(あ) lasting　(い) painful　(う) patient　(え) recent

III 小説（配点 30点）

次の文章は，ある物語の一節である。語り手の Maya は高校の陸上部の部長で，長年部を指導してきた Mr. Okafor が今年度で退職することを知ったところである。これを読んで，問1〜4に答えなさい。（配点 30点）

The track was empty by the time I found him. Mr. Okafor was sitting on the bottom row of the stands* with a clipboard on his knees, the way he had sat after every practice for the three years I had known him. His old whistle still hung from a cord around his neck, although practice had ended an hour before. The evening light made the red lanes look almost purple.

“You heard,” he said, without looking up.

“Everybody heard. Ms. Duarte announced it in assembly.” I sat down two rows above him. “You could have told us first.”

“(A).” He tapped his pen against the board. “I was going to tell the team on Friday. Then the principal decided it should be official.”

“Thirty-two years,” I said. “That’s what she said. Thirty-two years.”

“Thirty-three, actually. She can never get it right.”

For a while we watched a groundskeeper drag a hose across the long-jump pit*. Somewhere behind the gym a car alarm went off and stopped.

“Who’s going to coach us?” I asked.

“They’ll find someone. Probably someone young, with a stopwatch app and strong opinions about nutrition.” He almost smiled. “You’ll like them more than me.”

“That’s not funny.”

“(B).”

I picked at a splinter in the wooden bench. I wanted to say something important, something that would show him what the last three years had meant, but every sentence I started sounded like a greeting card. In the end what came out was, “I was terrible when I started. Do you remember?”

“I remember you fell over at the first hurdle and got up and ran the rest of the race with grass in your hair.”

“Everyone laughed.”

“Not everyone.” He turned around then, for the first time, and looked at me over his glasses. “I wrote your name down that day, on the list of runners I wanted to keep an eye on. (C).”

“Why?”

“Because you got up.” He shrugged, as if it were the most obvious thing in the world. “(1)I can teach almost anyone to run faster. I can’t teach that.”

My hands suddenly felt useless. I looked at the track, at the white lines that had been repainted so many times they had grown thick at the edges, and tried to picture someone else standing at the finish with a stopwatch.

“What will you do?” I asked. “After.”

“My daughter wants me to move closer to her. She has a garden that needs work and two boys who need someone to shout at them while they run.” He held up the clipboard. “I’ll still have this. (D).”

“You could come back. To watch, I mean. At the regional meet*.”

He said nothing for a while. (a)The man turned off the hose, and in the sudden silence I could hear the sprinklers ticking on the far field.

“Maybe,” he said. “If you promise not to make a speech.”

“I wasn’t going to make a speech.”

“(b)You were going to make a speech,” he said. “I could see it on your face.”

I laughed, and something in my chest loosened. He stood up slowly, the way his knees had made him stand up all spring, and tucked the clipboard under his arm.

“Go home, Maya. Captains need sleep too.” At the gate he stopped and looked back at the empty track. “(E).”

(2)I stayed until the lights came on, so that I would remember exactly how it looked.

注　stands　観客席
long-jump pit　走り幅跳びの砂場
regional meet　地区大会

問 1　空所(A)～(E)に入る最も適切なものを，選択肢(あ)～(お)からそれぞれ一つ選び，記号で答えなさい。ただし，同じ記号は一度しか使えない。

(あ) I know, and I’m sorry
(い) I meant it as a compliment
(う) It was a good place to work
(え) Yours was the only name on it that day
(お) Old habits

問 2　下線部(1)を，that の内容を明らかにして，日本語に訳しなさい。

問 3 波線部(a)・(b)が意味する内容に最も近いと思われる文を，それぞれの選択肢(あ)〜(え)から一つ選び，記号で答えなさい。

(a) The man turned off the hose, and in the sudden silence I could hear the sprinklers ticking on the far field.

(あ) The quiet scene shows the pause while Mr. Okafor thinks about Maya's invitation.
(い) The groundskeeper interrupts their conversation because it is getting late.
(う) Maya is annoyed by the noise of the sprinklers.
(え) Practice is about to start again on the far field.

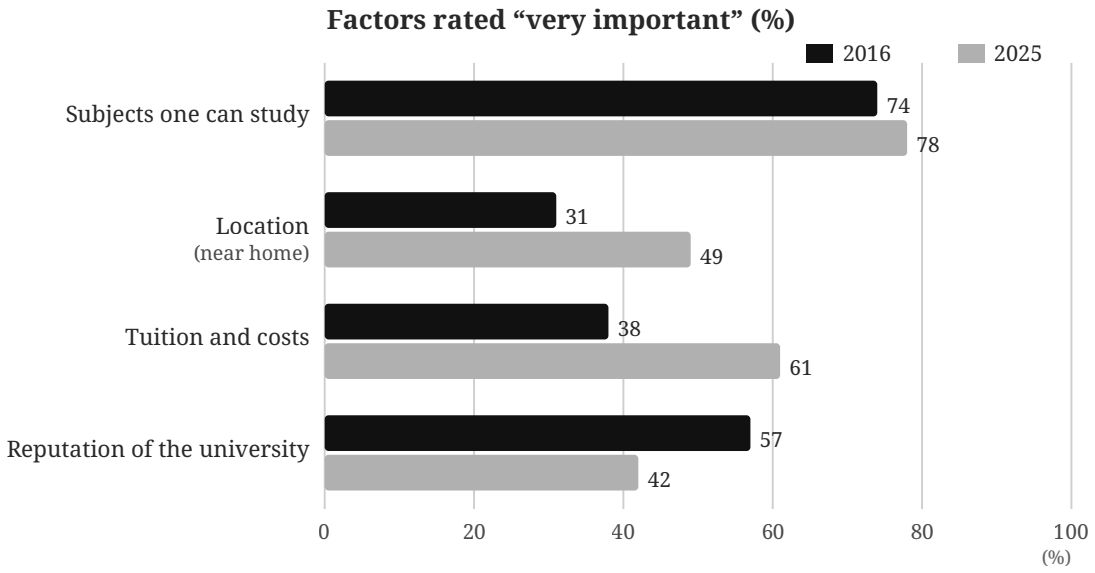

(b) You were going to make a speech

(あ) Mr. Okafor could tell that Maya had been about to say something emotional.
(い) Mr. Okafor asked Maya to give a speech at the regional meet.
(う) Mr. Okafor thought that Maya was bad at making speeches.
(え) Mr. Okafor had heard that Maya would speak in assembly.

問 4 下線部(2)で Maya がそのようにしたのはなぜか。本文の内容に即して，日本語で説明しなさい。

IV 英作文（配点 25点）

This graph presents the percentage of third-year high school students in one region who said that each factor was “very important” when choosing a university, in 2016 and in 2025. (The data are fictional.) Answer the questions below in English.（配点 25点）

(1) Select two of the four factors and compare the changes in the percentage of students who rated them “very important” between 2016 and 2025. Answer in English in about 40 words.

(2) Some people say that high school students should choose a university mainly by what they want to study, not by its location or reputation. Do you agree or disagree? Give reasons for your answer. Answer in English in about 60 words.
